

PHP - Project

LIMIT DATE : WEDNESDAY, JULY 10, 2019

Instructions:

A client, bookseller, contact you to realize his web site. He wants to sales his products online.

You will therefore develop an e-commerce book website.

The customer has transmitted informations and all its needs, here they are.

Structure:

A book is designated by a title, an release date, an author, a category and a format. An author is designated by name, year of birth, gender and biography.

Possible book format: pocket book or large format.

Example of possible book category: art / humor / thriller / fantasy ...

List of customer needs:

- Home page
Contains the presentation of the bookstore, the best sellers (3 articles).
- Products page
This is the page where we present the books for sale. This page will therefore include the list of products, filters, the 'add to cart' button ...
- Product page
This is actually the detail of the book. It will be necessary to display the general information (ex: description, author, biography).
- Contact page
This page contains the useful information of the library such as the address, telephone number and especially a contact form.
- Cart page
View all products added to your cart. The cart is empty by default. It empties when you finish / finish the command.
- Order page
Finalization of the order: we validate the cart by choosing, for example, the delivery address and the method of payment.
- Registration / Login Page
Allows the user to register or login to your site.
(Of course, a user can not order if he is not registered.)
- 'My account' page
The user account informations. We can also see a detail of orders.
- 'Administrator' page
The customer must be able to add / modify / delete a product on his site.

Bonus :

Implement the 'forgot password' feature with receiving email and a link to change his password.

Bonus 2:

You can sell something other than books, as long as the specifications are respected.
